Notes: This table shows summary statistics regarding the minimum wage, its bite, where it binds in the wage distribution, the share of hours worked below the effective minimum, and a measure of lower tail inequality, for each year and for each group in our data.

Table A1: Descriptive Statistics on the MW Bite for Different Groups (Cont.)

Year	<i>D. White</i>					<i>E. Black</i>					<i>F. Hispanic</i>				
	Minimum binding percentile	Maximum binding percentile	Share of hours at or below minimum	Share of hours strictly below minimum	Average $\log(p10) - \log(p50)$	Minimum binding percentile	Maximum binding percentile	Share of hours at or below minimum	Share of hours strictly below minimum	Average $\log(p10) - \log(p50)$	Minimum binding percentile	Maximum binding percentile	Share of hours at or below minimum	Share of hours strictly below minimum	Average $\log(p10) - \log(p50)$

Notes: This table shows point estimates at each percentile from our direct between-group SDD specifications, in which a p-th percentile measure of between-group inequality is regressed on a difference-in-difference indicator for our minimum wage events, and then scaled to reflect the effect of a 1 log point increase in the bite of the minimum wage on between-group inequality. Specifications for OLS and dosage estimators are shown; see the text for discussion of these estimators. Standard errors are bootstrapped using state-by-dataset clustering.

Simple Average	-0.89	-0.97	-0.07	2.12	2.15	+0.04	2.90	2.97	+0.07

Notes: This table shows weighted averages, for each event considered in the main SDD specification and during only the 3 pre-treatment years within each event window, of the minimum wage bite, the log pooled 5th percentile wage, and the log pooled median wage for the treated state of each event and its set of clean control states. The simple average across events is also displayed at the bottom.

Notes: This table shows point estimates at each percentile from our direct between-group TWFE specifications, in which a p-th percentile measure of between-group inequality is regressed on a quadratic in the minimum wage bite, as well as state and year fixed effects and a state-specific linear trend. Specifications estimated by OLS and TSLS in levels and first differences are shown.

Table A4: First Stage Diagnostic Statistics for TWFE Estimates

	<i>Panel A. Male-Female</i>		<i>Panel B. White-Black</i>		<i>Panel C. White-Hispanic</i>	
	TSLS Levels	TSLS FD	TSLS Levels	TSLS FD	TSLS Levels	TSLS FD
<i>Underidentification Test</i>						
Kleibergen-Paap LM Statistic, χ^2	19.61 (0.0001)	22.34 (0.0000)	14.50 (0.0007)	16.24 (0.0003)	7.23 (0.0269)	7.17 (0.0277)
<i>Weak Identification Test</i>						
Kleibergen-Paap Wald F-Statistic	62.25	248.19	49.38	243.67	66.58	281.24

Notes: This table shows diagnostic statistics for the first stages of our TSLS levels and first differences specifications estimated by two-way fixed effects. Note that the first stage is identical for every percentile for each group gap. The p -values for the Kleibergen-Paap LM statistic are shown in parentheses.

Observations	18629	18629	18629	11266	11266	11266	9659	9659	9659

Notes: This table shows point estimates at each percentile from within-group SDD specifications, in which a p-th percentile measure of within-group inequality is regressed on a difference-in-difference indicator for our minimum wage events and then scaled to reflect the effect of a 1 log point increase in the bite of the minimum wage on within-group inequality. Specifications for OLS and dosage estimators are shown; see the text for discussion of these estimators.

Notes: This table shows smoothed counterfactuals for lower-tail between-group inequality using the TWFE and SDD methods estimated on pooled data from 2015 to 2019 for a \$12 federal minimum wage (in 2020 dollars).

Appendix B: Figures

Figure B1a: Evolution of the minimum wage, not weighted by employment

Notes: This figure shows a version of Figure 1 in which the time series represent unweighted averages across all US states within each year. See the notes of Figure 1 for more details.

Figure B1b: Evolution of the minimum wage bite

Notes: This figure shows the trajectory of the national average minimum wage bite over time.

Figure B1c: Evolution of the binding percentiles of the minimum wage

Notes: This figure shows the trajectory of the state-specific binding percentiles of the minimum wage.

Figure B2: Share of work hours at or below the minimum wage

(a) Gender

(b) Race/ethnicity

Notes: This figure shows the national share of labor hours worked below the effective minimum wage in their state of residence by each demographic group over the period 1979-2019. The shares are weighted by CPS MORG sample weights multiplied by reported work hours (our baseline weights in most specifications).

Figure B3: Identified minimum wage increase events

Notes: This figure shows the state-level minimum wage increase events that form the basis of our stacked difference-in-difference specification and event studies. The blue circles represent all increases in excess of 3 percentage points (non-trivial events), while the red triangles indicate increases that our rule-based method selects for the non-successive, non-trivial events. See the text for more discussion of the rule-based selection of events.

Figure B4a: Robustness checks for the between-group TWFE specification

Notes: This figure shows point estimates from several specifications serving as robustness checks on the main between-group TWFE regressions estimated in levels by two-stage least squares. 95% confidence intervals are shown. The baseline is our main specification with no controls except for state and year fixed effects and linear state-specific trends. We also display specifications that (i) drop tipped occupations, (ii) include ages 16-74 in the sample, (iii) drop wages below \$2/hour instead of \$1/hour, (iv) use person sample weights rather than weights multiplied by reported labor hours, (v) include controls for time-varying state-level demographic composition, and (vi) use unbalanced panels that simply drop any cell with fewer than 50 relevant observations.

Figure B4b: Robustness checks for the between-group TWFE specification

Notes: See the notes for Figure B4a.

Figure B4c: Robustness checks for the between-group TWFE specification

Notes: See the notes for Figure B4a.

Figure B5: First stage effect of reforms on the minimum wage bite

Notes: This figure shows the coefficient estimates from our main dosage event study specification when the minimum wage bite is placed on the left-hand side of the equation. The gray shaded bars are 95% confidence intervals from the estimated event study's first stage equation. The solid red line represents the point estimate from the collapsed SDD specification, and the dotted red lines represent the 95% confidence interval around this point estimate. A solid red line at zero in the pre-treatment period is superimposed for display purposes; it is not estimated.

Figure B6a: Direct effect of minimum wage increases on gender wage inequality using SDD

Notes: These figures show our stacked event study results that use gender log wage inequality at various percentiles as the key dependent variable. We show results at the 5th, 10th, 20th, 30th, 70th, and 90th percentiles, as well as at the median and mean. The standard errors on each event-time coefficient (shaded grey bars representing 95% confidence intervals) are clustered at the state-by-dataset level. The SDD coefficient estimates for each percentile (which average together the post-treatment event-time coefficients) are superimposed on each sub-figure (solid red lines) with their respective standard errors (dashed red lines indicating the lower and upper bounds on the 95% confidence intervals). The top right corner of each plot displays an F-statistic for a test of whether the two pre-treatment coefficients are jointly distinguishable from zero.

Figure B6b: Direct effect of minimum wage increases on Black-White wage inequality using SDD

Notes: These figures show our stacked event study results that use Black-White log wage inequality at various percentiles as the key dependent variable. We show results at the 5th, 10th, 20th, 30th, 70th, and 90th percentiles, as well as at the median and mean. The standard errors on each event-time coefficient (shaded grey bars representing 95% confidence intervals) are clustered at the state-by-dataset level. The SDD coefficient estimates for each percentile (which average together the post-treatment event-time coefficients) are superimposed on each sub-figure (solid red lines) with their respective standard errors (dashed red lines indicating the lower and upper bounds on the 95% confidence intervals). The top right corner of each plot displays an F-statistic for a test of whether the two pre-treatment coefficients are jointly distinguishable from zero.

Figure B6c: Direct effect of minimum wage increases on Hispanic-White wage inequality using SDD

Notes: These figures show our stacked event study results that use Hispanic-White log wage inequality at various percentiles as the key dependent variable. We show results at the 5th, 10th, 20th, 30th, 70th, and 90th percentiles, as well as at the median and mean. The standard errors on each event-time coefficient (shaded grey bars representing 95% confidence intervals) are clustered at the state-by-dataset level. The SDD coefficient estimates for each percentile (which average together the post-treatment event-time coefficients) are superimposed on each sub-figure (solid red lines) with their respective standard errors (dashed red lines indicating the lower and upper bounds on the 95% confidence intervals). The top right corner of each plot displays an F-statistic for a test of whether the two pre-treatment coefficients are jointly distinguishable from zero.

Figure B7a: Effect of minimum wage increases on within-gender wage inequality using SDD

Notes: These figures show event studies estimated by our main SDD specification for within-group inequality. The shaded bars represent 95% confidence intervals.

Figure B7b: Effect of minimum wage increases on White and Black within-group inequality using SDD

Notes: See the notes for Figure B7a.

Figure B7c: Effect of minimum wage increases on White and Hispanic within-group wage inequality using SDD

Notes: See the notes for Figure B7a.

Figure B8a: SDD counterfactuals—Pooled equation

Notes: These figures show smoothed moving averages of estimated counterfactual changes in between-group inequality using the pooled SDD specification for each pair of groups and for each period. Standard errors around the smoothed moving averages are bootstrapped using 100 sets of SDD coefficients. See notes for Figure 5 for more details.

Figure B8b: TWFE counterfactuals—Pooled vs. within-group regression sample

Notes: These figures show smoothed moving averages of estimated counterfactual changes in between-group inequality using (i) the pooled TWFE specification and (ii) the within-group TWFE specification where only wages for the regression samples of individuals are incremented using the estimated coefficients. Standard errors around the smoothed moving averages are bootstrapped using 100 sets of TWFE coefficients. See notes for Figure 5 for more details.

Figure B9: Spatial distribution of race/ethnic groups, 1979-2019

Notes: This figure shows the spatial distribution of White, Black, and Hispanic workers, across US states, in pooled data from 1979 to 2019. Note that the color coding includes a capstone representing 10+ percentage points. These instances are labeled on the map, in particular for Hispanic workers in Texas and California.

Figure B10: Duncan Segregation Index, 1979-2019

Notes: This figure plots Duncan segregation indexes (DSI) using 50 states over time for White-Hispanic, White-Black, and Black-Hispanic spatial segregation.

Figure B11a: Reweighting exercises for racial/ethnic inequality, 1979-1989

Notes: See the notes for Figure 6 in the main text.

Figure B11b: Reweighting exercises for racial/ethnic inequality, 1989-1998

Notes: See the notes for Figure 6 in the main text.

Figure B11c: Reweighting exercises for racial/ethnic inequality, 1998-2007

Notes: See the notes for Figure 6 in the main text.

Figure B11d: Reweighting exercises for racial/ethnic inequality, 2007-2019

Notes: See the notes for Figure 6 in the main text.

Figure B12: Simulated minimum wage bites under federal minimum wages

Notes: This figure displays density plots over US states of (i) the actual minimum wage bites observed in pooled data from 2015 to 2019, (ii) the actual minimum wage bites observed in 1979, and (iii) simulated minimum wage bites in pooled data from 2015 to 2019 if the federal minimum wage were bumped up to \$10, \$12, and \$15. All dollar amounts are in 2020 dollars.
